Do I need a ground for a substation battery rack?

For a standard substation DC battery rack, I am having trouble determining whether a ground is required to be installed along with the wires between the battery disconnect switch and the battery rack. It's 125VDC. My usual approach is to include a ground until I can prove that a ground is not useful or is detrimental to the system.

Do I need a ground for a 125VDC battery?

It's 125VDC. My usual approach is to include a ground until I can prove that a ground is not useful or is detrimental to the system. I have seen installations done both ways. 2/C with a ground and also 2 wires without a ground. When the ground is included, it is usually bonded right to the battery rack.

Why should a DC battery system be grounded?

The ancillary equipment (charging units, etc) would be grounded. Grounding of DC battery system enhances safety really because, if ungrounded, any short of power conductor to battery system would not be cleared by OCPD and personnel doing routine maintenance on the batteries are liable to be shocked or to suffer worse than that.

Can a DC rack cause a ground fault?

The potential for a grounded rack or other DC equipment allowing a ground fault is greatly increased if there are intentional equipment grounds installed. Ground alarms were installed on every DC system. Safety hazards are relatively small, since contact from ground to either ungrounded polarity does not constitute a circuit.

If you do connect, say the negative terminal of the battery to the case, and ground the case, you've now made a second electrical ...

If you have a home battery backup, it is essential to ground it correctly. Consult a qualified electrician to ensure proper installation and adherence to local codes.
