By feeding power back into the grid during peak periods, drivers can generate additional income, offsetting charging costs and improving the total cost of ownership. Despite ...

The study finds deploying low-cost slow chargers as economically optimal, with Time-of-Use and bidirectional charging strategies reducing charging costs by 18% and 35% respectively.

While challenges remain, ongoing advancements in technology, supportive regulatory frameworks, and increased consumer awareness are paving the way for the ...

Bi-directional charging (BDC) is a solution that allows EVs to not only consume energy from the grid but also supply energy back to the grid. This facilitates vehicle-to-load ...

Given the right energy management solutions, bidirectional charging, or V2X, could add significant storage capacity for these systems. In addition, pairing a V2X system with ...

We propose a multi-type bidirectional power transfer network and minimize the system cost by determining facility siting and pricing, which can be modeled as a bi-level ...

Through V2G, bidirectional charging could be used for demand cost reduction and/or participation in utility demand response programs as part of a grid-efficient interactive building (GEB) strategy.

Through V2G, bidirectional charging could be used for demand cost reduction and/or participation in utility demand response programs as part ...
