---

It provides a gauge of the relative efficiency of different glass or glazing types in transmitting daylight while blocking heat gains. The higher the number, the more light transmitted without ...

U-value measures a window's rate of heat loss, or how much heat your home loses through the window. Like the solar heat gain coefficient, it's depicted as a number ...

In colder climates, the ideal window for a South-facing wall has a higher solar heat gain coefficient (SHGC) and a low U-factor to reduce heat loss. Windows that face East and West should have ...

When purchasing ENERGY STAR qualified windows, look for the U-Factor and the Solar Heat Gain Coefficient (SHGC). The U-Factor measures how well the window insulates.

The circled value shows you the rating a specific door has received based on its glass configuration. Each rating is split into two values: Solar Heat Gain, and U-Factor.

Understanding the energy performance numbers will help you select the right glass package to achieve maximum results for your home. If you've already purchased windows, the NFRC ...

Solar Heat Gain Coefficient (SHGC) measures the fraction of solar energy transmitted and tells you how well the product blocks heat caused by sunlight. SHGC is measured on a scale of 0 ...
