When should I use a combiner box in my solar power system?

You should use a combiner box in your solar power system when you have more than three strings of solar panels. It is essential for enhancing the protection of your inverter and providing a rapid shutdown mechanism in case of sudden voltage fluctuations. A combiner box simplifies the wiring to the inverter.

What is a photovoltaic AC combiner box?

The photovoltaic AC combiner box is used in a photovoltaic power generation system with string inverters and is installed between the AC output side of the inverter and the grid connection point/load. It is internally equipped with input circuit breakers, output circuit breakers, and AC lightning arresters.

How does a solar combiner work?

Each string consists of solar modules wired in series, and the combiner box gathers multiple strings into a single output while ensuring safety and system efficiency. Current Collection: Consolidates DC output from 6-24 strings into busbars. Circuit Protection: Prevents overcurrent, lightning damage, and reverse current.

What temperature should a combiner box be installed?

The installation ambient temperature of the combiner box should be between -25°C and +60°C, and the relative humidity should be between 0 and 95%. The combiner box should be installed in a dry, well-ventilated and dust-proof place. Incoming and outgoing line type and installation method: Armored cable enters and exits from the bottom.
