How do flow batteries work?

Flow batteries operate distinctively from "solid" batteries (e.g., lead and lithium) in that a flow battery's energy is stored in the liquid electrolytes that are pumped through the battery system (see image above) while a solid-state battery stores its energy in solid electrodes. There are several components that make up a flow battery system:

What are the different types of flow batteries?

Some of the types of flow batteries include: Vanadium redox flow battery (VRFB) - is currently the most commercialized and technologically mature flow battery technology. All iron flow battery - All-iron flow batteries are divided into acidic and alkaline systems, and acidic all-iron flow batteries are relatively mature in commercial development.

What are flow batteries used for?

Renewable Energy Source Integration: Flow batteries help the grid during periods of low generation, making it easier to integrate intermittent renewable energy sources like wind and solar. For example, flow batteries are used at the Semptra Energy and SDG&E plant to store excess solar energy, which is then released during times of high demand.

Can flow batteries be used as backup generators?

Flow batteries can serve as backup generators for the electric grid. Flow batteries are one of the key pillars of a decarbonization strategy to store energy from renewable energy resources. Their advantage is that they can be built at any scale, from the lab-bench scale, as in the PNNL study, to the size of a city block.

The vanadium redox flow battery is a promising technology for grid scale energy storage. The tanks of reactants react through a membrane and charge is added or removed as the ...
